Attachment 1: Photo documentation – 4 pages (page 205-208)

**Summary of testing:**

All tests passed. There is no construction break within the frame size.

**In case of alternative test programs for circuit breakers with a different number of poles, the following program is used:**

- Programme 1 (three pole fully tested)**  
 **Programme 2 (four pole fully tested)**  
 **Alternative program not applicable**

| Type      | No. of Pole | Ue (V) | In (A) | Test current (kA) |     | Test sequence and number of samples |    |        |     |    |         |
|-----------|-------------|--------|--------|-------------------|-----|-------------------------------------|----|--------|-----|----|---------|
|           |             |        |        | Ics               | Icu | I                                   | II | II/III | III | IV | Annex F |

## Releases :

- 1) shunt release ..... : No
- 2) Over-current release..... : Yes
- a) instantaneous..... : Yes
- b) definite time delay..... : No
- c) inverse time delay..... : Yes
- independent of previous load ..... : No
- dependent on previous load; (for example thermal type release)..... : Yes
- 3) Undervoltage release (for opening) ..... : No
- 4) Closing releases..... : No
- 5) Other releases..... : No

## Characteristics :

- 1) Shunt release and undervoltage release (for opening), and closing release..... : N/A
- rated control circuit voltage:  $U_c$  ( nature, frequency, V) ... : N/A
- kind of current ..... : N/A
- rated frequency: (if AC)..... : N/A
- 2) Over-current release..... : See blow
- rated current..... : 250A
- kind of current ..... : 100/125/140/150/160/180/200/225/250A
- rated frequency: (if AC)..... : 50/60Hz
- current setting (or range of settings) ..... :  $I_i=10I_n\pm 20\%$ ;  $I_r=I_n$
- time settings (or range of settings)..... :  $t<600s$  (@  $2I_n$ )

|              | The requirements of 7.1.2 of IEC 60947:2007/AMD1:2010/AMD2:2014 do not apply to parts with a mass lower than 2 g (insignificant mass, in accordance with 3.14 of IEC 60695-2-11:2014). For products containing a plurality of small parts, the total mass of non-tested parts located in close proximity to each other shall not exceed 10 g. Proximity shall be based on engineering judgment that takes into consideration the risk of propagation of fire. |                                                                                                                                                        | P       |

|              | Flames and glowing extinguish within 30 s                                                                                                                                                                                                                                                                           |                 | N/A     |
|              | No ignition of the tissue paper                                                                                                                                                                                                                                                                                     |                 | P       |
| 7.1.2.3      | Test based on flammability category                                                                                                                                                                                                                                                                                 |                 |         |
|              | For parts of insulating materials, hot wire ignition and, where applicable, arc ignition tests as specified in 8.2.1.1.2, shall be made based on flammability category                                                                                                                                              |                 | N/A     |
|              | Tests on materials are made in accordance with Annex M                                                                                                                                                                                                                                                              |                 | N/A     |
|              | The hot wire ignition (HWI) and arc ignition (AI) test value requirements related to the material flammability category shall conform to Table M.1 or M.2                                                                                                                                                           |                 | N/A     |
|              | Alternatively, the manufacturer may provide data from the insulating material supplier fulfilling the requirements given in Annex M                                                                                                                                                                                 |                 | N/A     |
| 7.1.3 part 1 | Current-carrying parts and their connections                                                                                                                                                                                                                                                                        |                 |         |
|              | Current-carrying parts have the necessary mechanical strength and current-carrying capacity for their intended use                                                                                                                                                                                                  |                 | N/A     |
|              | For electrical connections, no contact pressure is transmitted through insulating material other than ceramic or other material with characteristics not less suitable, unless there is sufficient resiliency in the metallic parts to compensate for any possible shrinkage or yielding of the insulation material |                 | N/A     |

| IEC 60947-2  |                                                                                                                                                                                                                                                 |                 |         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| Clause       | Requirement + Test                                                                                                                                                                                                                              | Result - Remark | Verdict |
| 7.1.5 part 1 | Actuator                                                                                                                                                                                                                                        |                 |         |
| 7.1.5.1      | Insulation                                                                                                                                                                                                                                      |                 |         |
|              | The actuator of the equipment shall be insulated from the live parts for the rated insulation voltage and, if applicable, the rated impulse withstand voltage                                                                                   |                 | P       |
|              | If it is made of metal, it shall be capable of being satisfactorily connected to a protective conductor unless it is provided with additional reliable insulation                                                                               |                 | N/A     |
|              | If it is made of or covered by insulating material, any internal metal part, which might become accessible in the event of insulation failure, shall also be insulated from live parts for the rated insulation voltage                         |                 | P       |
| 7.1.5.2      | Direction of movement                                                                                                                                                                                                                           |                 |         |
|              | The direction of operation for actuators of devices shall normally conform to IEC 60447.                                                                                                                                                        |                 | P       |
|              | Where devices cannot conform to these requirements, e.g. due to special applications or alternative mounting positions, they shall be clearly marked such that there is no doubt as to the "I" and "O" positions and the direction of operation |                 | P       |
| 7.1.6 part 1 | Indication of contact position                                                                                                                                                                                                                  |                 |         |
| 7.1.6.1      | Indicating means                                                                                                                                                                                                                                |                 |         |
|              | When an equipment is provided with means for indicating the closed and open positions, these positions shall be unambiguous and clearly indicated                                                                                               |                 | P       |
|              | This is done by means of a position indicating device (see 2.3.18)                                                                                                                                                                              |                 | P       |
|              | If symbols are used, they shall indicate the closed and open position respectively, in accordance with IEC 60417-2:                                                                                                                             |                 |         |
|              | - 60417-2-IEC-5007 <b>I</b> On (power)                                                                                                                                                                                                          |                 | P       |
|              | - 60417-2-IEC-5007 <b>O</b> Off (power)                                                                                                                                                                                                         |                 | P       |
|              | For equipment operated by means of two push-buttons, only the push-button designated for the opening operation shall be red or marked with the symbol "O"                                                                                       |                 | N/A     |
|              | Red colour shall not be used for any other push-button                                                                                                                                                                                          |                 | N/A     |
|              | The colours of other push-buttons, illuminated push-buttons and indicator lights shall be in accordance with IEC 60073                                                                                                                          |                 | N/A     |

| Clause           | Requirement + Test                                                                                                                                                                                                                                                                                         | Result - Remark | Verdict |
| 7.1.10<br>part 1 | Provisions for protective earthing                                                                                                                                                                                                                                                                         |                 |         |
| 7.1.10.1         | The exposed conductive parts (e.g. chassis, framework and fixed parts of metal enclosures) other than those which cannot constitute a danger shall be electrically interconnected and connected to a protective earth terminal for connection to an earth electrode or to an external protective conductor |                 | N/A     |
|                  | This requirement can be met by the normal structural parts providing adequate electrical continuity and applies whether the equipment is used on its own or incorporated in an assembly                                                                                                                    |                 | N/A     |
|                  | Exposed conductive parts are considered not to constitute a danger if they cannot be touched on large areas or grasped with the hand or if they are of small size (approximately 50 mm x 50 mm) or are so located as to exclude any contact with live parts                                                |                 | N/A     |
| 7.1.10.2         | Protective earth terminal                                                                                                                                                                                                                                                                                  |                 |         |
|                  | The protective earth terminal shall be readily accessible and so placed that the connection of the equipment to the earth electrode or to the protective conductor is maintained when the cover or any other removable part is removed                                                                     |                 | N/A     |
|                  | The protective earth terminal shall be suitably protected against corrosion                                                                                                                                                                                                                                |                 | N/A     |
|                  | In the case of equipment with conductive structures, enclosures, etc., means shall be provided, if necessary, to ensure electrical continuity between the exposed conductive parts the equipment and the metal sheathing of connecting conductors                                                          |                 | N/A     |
|                  | The protective earth terminal shall have no other function, except when it is intended to be connected to a PEN conductor (see 2.1.1.5 – Note). In this case, it shall also have the function of a neutral terminal in addition to meeting the requirements applicable to the protective earth terminal    |                 | N/A     |
| 7.1.10.3         | Protective earth terminal marking and identification                                                                                                                                                                                                                                                       |                 |         |
|                  | The protective earth terminal shall be clearly and permanently identified by its marking                                                                                                                                                                                                                   |                 | N/A     |
|                  | The identification shall be achieved by colour (green-yellow mark) or by the notation PE, or PEN, as applicable, in accordance with IEC 60445, subclause 5.3, or, in the case of PEN, by a graphical symbol for use on equipment                                                                           |                 | N/A     |

| IEC 60947-2      |                                                                                                                                                                                                                                 |                 |         |

| 7.1.7.2     | Supplementary requirements for equipment with provision for electrical interlocking with contactors or circuit-breakers:                                                                                                                                                                                    |                 |         |
|             | auxiliary switch shall be rated according to IEC 60 947-5-1                                                                                                                                                                                                                                                 |                 | N/A     |
|             | If equipment suitable for isolation is provided with an auxiliary switch for the purpose of electrical interlocking with contactor (s) or circuit-breaker(s) and intended to be used in motor circuits, the following requirements shall apply unless the equipment is rated for AC-23 utilization category |                 | N/A     |
|             | The time interval between the opening of the contacts of the auxiliary switch and the contacts of the main poles shall be sufficient to ensure that the associated contactor or circuit-breaker interrupts the current before the main poles of the equipment open                                          |                 | N/A     |
|             | Unless otherwise stated in the manufacturer's technical literature, the time interval shall be not less than 20 ms when the equipment is operated according to the manufacturer instructions                                                                                                                |                 | N/A     |
|             | Compliance shall be verified by measuring the time interval between the instant of opening of the auxiliary switch and the instant of opening of the main poles under no-load conditions when the equipment is operated according to the manufacturer's instructions                                        |                 | N/A     |
|             | During the closing operation the contacts of the auxiliary switch shall close after or simultaneously with the contacts of the main poles                                                                                                                                                                   |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                         |                 |         |

| Clause      | Requirement + Test                                                                                                                                                                                                    | Result - Remark | Verdict |
|             | A circuit-breaker with dependent power operation shall operate with the operating mechanism charged to the minimum and maximum limits stated by the manufacturer                                                      |                 | N/A     |
|             | A circuit-breaker with stored energy operation shall comply with the requirements stated in 7.2.1.6 with the auxiliary supply voltage at 85% and 110% of the rated control supply voltage.                            |                 | N/A     |
|             | It shall also be verified that the moving contacts cannot be moved from the open position when the operating mechanism is charged to slightly below the full charge as evidenced by the indicating device             |                 | N/A     |
|             | For a trip-free circuit-breaker it shall not be possible to maintain the contacts in the touching or closed position when the tripping release is in the position to trip the circuit-breaker                         |                 | P       |
|             | If the closing and opening times of a circuit-breaker are stated by the manufacturer, such times shall comply with the stated values                                                                                  |                 | P       |
| 8.3.3.4.2.3 | Undervoltage releases                                                                                                                                                                                                 |                 |         |
|             | Undervoltage releases shall comply with the requirements of 7.2.1.3 of Part 1. For this purpose, the release shall be fitted to a circuit-breaker having the maximum current rating for which the release is suitable |                 | N/A     |
| i)          | Drop out voltage                                                                                                                                                                                                      |                 |         |
|             | It shall be verified that the release operates to open the circuit-breaker between the voltage limits specified                                                                                                       |                 | N/A     |
|             | The voltage shall be reduced from rated voltage at a rate to reach 0 V in approximately 30 s                                                                                                                          |                 | N/A     |
|             | The test for the lower limit is made without current in the main circuit and without previous heating of the release coil                                                                                             |                 | N/A     |
|             | In the case of a release with a range of rated voltages, this test applies to the maximum voltage of the range                                                                                                        |                 | N/A     |
|             | The test for the upper limit is made starting from a constant temperature corresponding to the application of rated control supply voltage to the release and rated current in the main poles of the circuit-breaker  |                 | N/A     |
|             | This test may be combined with the temperature-rise test of 8.3.3.7                                                                                                                                                   |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                                                                       |                 |         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| Clause      | Requirement + Test                                                                                                                                                                                                                                    | Result - Remark | Verdict |
|             | In the case of a release with a range of rated voltages, this test is made at both the minimum and maximum rated control supply voltages                                                                                                              |                 | N/A     |
| ii)         | Test for limits of operation                                                                                                                                                                                                                          |                 |         |
|             | Starting with the circuit-breaker open, at the temperature of the test room, and with the supply voltage at 30% rated maximum control supply voltage, it shall be verified that the circuit-breaker cannot be closed by the operation of the actuator |                 | N/A     |
|             | When the supply voltage is raised to 85% of the minimum control supply voltage, it shall be verified that the circuit-breaker can be closed by the operation of the actuator                                                                          |                 | N/A     |
| iii)        | Performance under overvoltage conditions                                                                                                                                                                                                              |                 |         |
|             | With the circuit-breaker closed and without current in the main circuit, it shall be verified that the undervoltage release will withstand the application of 110% rated control supply voltage for 4 h without impairing its functions               |                 | N/A     |
| 8.3.3.4.2.4 | Shunt releases                                                                                                                                                                                                                                        |                 |         |
|             | Shunt releases shall comply with the requirements of 7.2.1.4 of Part 1. For this purpose, the release shall be fitted to a circuit-breaker having the maximum rated current for which the release is suitable                                         |                 | N/A     |
|             | It shall be verified that the release will operate to open the circuit-breaker at 70% rated control supply voltage when tested at an ambient temperature of $+55\text{ °C} \pm 2\text{ °C}$ without current in the main poles of the circuit-breaker  |                 | N/A     |
|             | In the case of a release having a range of rated control supply voltages, the test voltage shall be 70% of the minimum rated control supply voltage                                                                                                   |                 | N/A     |
| 8.3.3.4.3   | Operational performance capability without current.                                                                                                                                                                                                   |                 |         |
|             | Type designation or serial number catalogue reference                                                                                                                                                                                                 | YCM1-250L       |         |

| 2)          | - where appropriate, between each part of the control an auxiliary circuits which may be isolated from the other parts during normal operation and all the other parts connected together.                                               |                 | N/A     |
|             | No unintentional disruptive discharge during the tests                                                                                                                                                                                   |                 | N/A     |
| (i)         | the normal positions of operation include the tripped position, if any;                                                                                                                                                                  |                 | N/A     |
| (ii)        | circuits incorporating solid-state devices connected to the main circuit shall be disconnected for the test;                                                                                                                             |                 | N/A     |
| (iii)       | circuit-breakers not declared as suitable for isolation shall be tested with the test voltage applied across the poles of the main circuit, the line terminals being connected together and the load terminals being connected together. |                 | N/A     |
| (iv)        | For circuit-breaker suitable for isolation, the leakage current shall be measured through each pole with the contacts in the open position, at a test voltage of $1,1 U_e$ , and shall not exceed 0,5mA.                                 | 457V<br><0,01mA | N/A     |
| (v)         | circuit-breakers having a rated insulation voltage greater than 1 000 V a.c. shall be tested at a voltage of $U_i + 1\ 200\ \text{V a.c. r.m.s.}$ or $2 U_i$ whichever is the greater                                                    |                 | N/A     |
| (vi)        | withdrawable circuit-breakers shall be subject to verification of impulse withstand voltage and shall be applied between the withdrawable unit's main contacts and their associated fixed contacts, in the disconnected position.        |                 | N/A     |
| 8.3.3.4     | Mechanical operation and operational performance capability                                                                                                                                                                              |                 |         |
| 8.3.3.4.2   | Construction and mechanical operation                                                                                                                                                                                                    |                 |         |
| 8.3.3.4.2.1 | Construction                                                                                                                                                                                                                             |                 |         |
|             | A withdrawable circuit-breaker shall be checked for the requirements stated in 7.1.2                                                                                                                                                     |                 | N/A     |
|             | A circuit-breaker with stored energy operation shall be checked for compliance with 7.2.1.1.6, regarding the charge indicator and the direction of operation of manual energy storing                                                    |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                                       |                 |         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| Clause      | Requirement + Test                                                                                                                                                                                                    | Result - Remark | Verdict |
| 8.3.3.4.2.2 | Mechanical operation                                                                                                                                                                                                  |                 |         |
|             | A circuit-breaker with dependent power operation shall comply with the requirements stated in 7.2.1.1.4                                                                                                               |                 | N/A     |
|             | A circuit-breaker with dependent power operation shall operate with the operating mechanism charged to the minimum and maximum limits stated by the manufacturer                                                      |                 | N/A     |
|             | A circuit-breaker with stored energy operation shall comply with the requirements stated in 7.2.1.6 with the auxiliary supply voltage at 85% and 110% of the rated control supply voltage.                            |                 | N/A     |
|             | It shall also be verified that the moving contacts cannot be moved from the open position when the operating mechanism is charged to slightly below the full charge as evidenced by the indicating device             |                 | N/A     |
|             | For a trip-free circuit-breaker it shall not be possible to maintain the contacts in the touching or closed position when the tripping release is in the position to trip the circuit-breaker                         |                 | P       |
|             | If the closing and opening times of a circuit-breaker are stated by the manufacturer, such times shall comply with the stated values                                                                                  |                 | P       |
| 8.3.3.4.2.3 | Undervoltage releases                                                                                                                                                                                                 |                 |         |
|             | Undervoltage releases shall comply with the requirements of 7.2.1.3 of Part 1. For this purpose, the release shall be fitted to a circuit-breaker having the maximum current rating for which the release is suitable |                 | N/A     |
| i)          | Drop out voltage                                                                                                                                                                                                      |                 |         |
|             | It shall be verified that the release operates to open the circuit-breaker between the voltage limits specified                                                                                                       |                 | N/A     |
|             | The voltage shall be reduced from rated voltage at a rate to reach 0 V in approximately 30 s                                                                                                                          |                 | N/A     |
|             | The test for the lower limit is made without current in the main circuit and without previous heating of the release coil                                                                                             |                 | N/A     |
|             | In the case of a release with a range of rated voltages, this test applies to the maximum voltage of the range                                                                                                        |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                                                                       |                 |         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| Clause      | Requirement + Test                                                                                                                                                                                                                                    | Result - Remark | Verdict |
|             | The test for the upper limit is made starting from a constant temperature corresponding to the application of rated control supply voltage to the release and rated current in the main poles of the circuit-breaker                                  |                 | N/A     |
|             | This test may be combined with the temperature-rise test of 8.3.3.7                                                                                                                                                                                   |                 | N/A     |
|             | In the case of a release with a range of rated voltages, this test is made at both the minimum and maximum rated control supply voltages                                                                                                              |                 | N/A     |
| ii)         | Test for limits of operation                                                                                                                                                                                                                          |                 |         |
|             | Starting with the circuit-breaker open, at the temperature of the test room, and with the supply voltage at 30% rated maximum control supply voltage, it shall be verified that the circuit-breaker cannot be closed by the operation of the actuator |                 | N/A     |
|             | When the supply voltage is raised to 85% of the minimum control supply voltage, it shall be verified that the circuit-breaker can be closed by the operation of the actuator                                                                          |                 | N/A     |
| iii)        | Performance under overvoltage conditions                                                                                                                                                                                                              |                 |         |
|             | With the circuit-breaker closed and without current in the main circuit, it shall be verified that the undervoltage release will withstand the application of 110% rated control supply voltage for 4 h without impairing its functions               |                 | N/A     |
| 8.3.3.4.2.4 | Shunt releases                                                                                                                                                                                                                                        |                 |         |
|             | Shunt releases shall comply with the requirements of 7.2.1.4 of Part 1. For this purpose, the release shall be fitted to a circuit-breaker having the maximum rated current for which the release is suitable                                         |                 | N/A     |
|             | It shall be verified that the release will operate to open the circuit-breaker at 70% rated control supply voltage when tested at an ambient temperature of $+55\text{ °C} \pm 2\text{ °C}$ without current in the main poles of the circuit-breaker  |                 | N/A     |
|             | In the case of a release having a range of rated control supply voltages, the test voltage shall be 70% of the minimum rated control supply voltage                                                                                                   |                 | N/A     |

|             | The applicability of the tests specified in this clause when $I\Delta n > 30$ A is subject to agreement between manufacturer and user.                                                                                                                                                             |                 |         |
|             | The instruments for the measurement of the residual current shall show (or permit to determine) the true r.m.s. value.                                                                                                                                                                             |                 | N/A     |
| B.8.1.2     | Tests to be made during the test sequences of clause 8                                                                                                                                                                                                                                             |                 | N/A     |
| B.8.1.2.1   | General performance characteristics (test sequence I)                                                                                                                                                                                                                                              |                 |         |
|             | For the verification of the short-circuit releases of electronic overcurrent releases, the pole under test shall be tested in series with one other pole chosen at random;                                                                                                                         |                 |         |
|             | For the verification of the short-circuit releases of electromagnetic overcurrent releases, the additional verification in single pole need not be carried out;                                                                                                                                    |                 |         |
|             | For the verification of the overload release of the neutral pole, this pole shall be tested in series with 2 other poles connected in parallel;                                                                                                                                                    |                 |         |
|             | Alternatively, when feasible and with the agreement of the manufacturer, the residual current function may be rendered inoperative;                                                                                                                                                                |                 |         |
|             | The test conditions shall be stated in the test report.                                                                                                                                                                                                                                            |                 |         |
|             | During the operating cycles with current a third of the breaking operations shall be performed by actuating the test device, and a further third by applying a residual current of value $I\Delta n$ (or, if applicable, of the lowest setting of the residual operating current) to any one pole. |                 | N/A     |
|             | In the case of a reset-CBR, it is not possible to reclose the CBR after tripping without the intentional resetting action. This verification shall take place at the beginning and at the end of the operational performance capability test with current                                          |                 | N/A     |
|             | No failure to trip shall be admitted.                                                                                                                                                                                                                                                              |                 | N/A     |
| B.8.1.2.2   | Verification of the withstand capability to short-circuit currents                                                                                                                                                                                                                                 |                 |         |
| B.8.1.2.2.1 | Rated service short-circuit breaking capacity (test sequence II)                                                                                                                                                                                                                                   |                 |         |
|             | Following the tests of 8.3.4, verification of the correct operation of the CBR in case of residual current shall be performed in accordance with B.8.2.4.2.                                                                                                                                        |                 |         |
| B.8.2.4.2   | Verification of operating in case of steady increase of the residual current (figure B.1)                                                                                                                                                                                                          |                 |         |
|             | Increase the residual current from $0,2 I\Delta n$ to $I\Delta n$ in 30 sec.<br>Required: value between $I\Delta n_{0}$ and $I\Delta n$                                                                                                                                                            |                 | N/A     |

|             | Tests shall be made at the following values of voltage applied to the relevant terminals:<br>- 0,85 times the minimum rated voltage for the tests specified in B.8.2.4 and B.8.2.5.2;<br>- 1,1 times the maximum rated voltage for the tests specified in B.8.2.5.3.                                                                                                                                                                                                                  |                 | N/A     |
|             | For CBRs having functions which do not depend on line voltage, tests of those functions may be carried out at any convenient voltage                                                                                                                                                                                                                                                                                                                                                  |                 | N/A     |
|             | CBRs with more than one rated frequency or a range of rated frequencies shall be tested in each case at the highest and lowest rated frequency. However, for CBRs rated at 50 Hz and 60 Hz, tests at 50 Hz or 60 Hz are considered to cover the requirements.                                                                                                                                                                                                                         |                 | N/A     |
|             | For tests where the poles are loaded with rated current or above (see for example B.8.2.5.3, B.8.7.2.3, B.8.8.8.2 and B.8.8.9), for practical reasons, it is acceptable to use a sample where the voltage pick-up conductors have been separated from the phase poles, to allow the use of a low-power source for the loading with current. The details of the modification shall be agreed between the manufacturer and the testing station, and shall be stated in the test report. |                 | N/A     |
| B.8.2.4     | Off-load test at 20 °C ± 5 °C                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                 |         |
| B.8.2.4.2   | Verification of operating in case of steady increase of the residual current (figure B.1)                                                                                                                                                                                                                                                                                                                                                                                             |                 | N/A     |

|             | Tests shall be made at the following values of voltage applied to the relevant terminals:<br>- 0,85 times the minimum rated voltage for the tests specified in B.8.2.4 and B.8.2.5.2;<br>- 1,1 times the maximum rated voltage for the tests specified in B.8.2.5.3.                                                                                                                                                                                                                  |                 | N/A     |
|             | For CBRs having functions which do not depend on line voltage, tests of those functions may be carried out at any convenient voltage                                                                                                                                                                                                                                                                                                                                                  |                 | N/A     |
|             | CBRs with more than one rated frequency or a range of rated frequencies shall be tested in each case at the highest and lowest rated frequency. However, for CBRs rated at 50 Hz and 60 Hz, tests at 50 Hz or 60 Hz are considered to cover the requirements.                                                                                                                                                                                                                         |                 | N/A     |
|             | For tests where the poles are loaded with rated current or above (see for example B.8.2.5.3, B.8.7.2.3, B.8.8.8.2 and B.8.8.9), for practical reasons, it is acceptable to use a sample where the voltage pick-up conductors have been separated from the phase poles, to allow the use of a low-power source for the loading with current. The details of the modification shall be agreed between the manufacturer and the testing station, and shall be stated in the test report. |                 | N/A     |
| B.8.7.2.1   | Verification of operation in case of a continuous rise of a residual pulsating direct current                                                                                                                                                                                                                                                                                                                                                                                         |                 | N/A     |

| Clause      | Requirement + Test                                                                                                                                                                                                                                                                                                                                                                                                            | Result - Remark | Verdict |
|             | The terminals that have been removed from the product shall be attached to conducting parts of the same cross-section, shape, metal and finish as those on which they are mounted on the product.                                                                                                                                                                                                                             |                 |         |
|             | The conducting part shall not exceed:                                                                                                                                                                                                                                                                                                                                                                                         |                 |         |
|             | (i) three times the length of the terminal,                                                                                                                                                                                                                                                                                                                                                                                   |                 | N/A     |
|             | (ii) the width of the terminal                                                                                                                                                                                                                                                                                                                                                                                                |                 | N/A     |
|             | To avoid excessive oxidation of the conductor and ensure proper connection, a sufficient length of insulation shall be removed immediately prior to installation                                                                                                                                                                                                                                                              |                 |         |
|             | The wire shall be positioned so that 6 mm to 13 mm of the bare conductor is exposed between the wire-entry face of the terminal and the beginning of the insulation. There shall be no mechanical removal or chemical treatment of any oxide on the surface of the conductor entering the terminal, unless it is explicitly required by the manufacturer's instructions, in which case it shall be stated in the test report. |                 |         |
| D.8.2.3     | Test arrangement                                                                                                                                                                                                                                                                                                                                                                                                              |                 | N/A     |
|             | The length of the test conductor from the point of entry to the terminal specimens to the equalizer shall be as in Table D.2                                                                                                                                                                                                                                                                                                  |                 | N/A     |
|             | Test conductors shall be connected in series with a reference conductor of the same cross-section. The length of the reference conductor shall be approximately twice the length of the test conductor.                                                                                                                                                                                                                       |                 | N/A     |
|             | 90 % of the value of torque stated by the manufacturer or, if not stated, selected in Table 4 of part 1, shall be used to connect the aluminium cables to the terminal specimens.                                                                                                                                                                                                                                             |                 | N/A     |
|             | The distance between the test and reference conductors shall be at least 150 mm.                                                                                                                                                                                                                                                                                                                                              |                 | N/A     |
|             | Thermal barriers shall be installed mid- way between the conductors and shall extend 25 mm $\pm$ 5 mm widthways and 150 mm $\pm$ 10 mm lengthways beyond the terminals (see Figure D.1).                                                                                                                                                                                                                                      |                 | N/A     |
|             | Thermal barriers are not required provided the specimens are separated by at least 450 mm.                                                                                                                                                                                                                                                                                                                                    |                 | N/A     |
|             | The specimens shall be located at least 600 mm from the floor, wall or ceiling.                                                                                                                                                                                                                                                                                                                                               |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                                                                                                       |                 |         |

| Clause      | Requirement + Test                                                                                                                                                                                                                                                                    | Result - Remark | Verdict |
|             | The test specimens shall be located in a substantially vibration-free and draught-free environment and at an ambient air temperature between 15 °C and 35 °C. Once the test is started, the maximum permissible variation is $\pm 4$ K provided the range limitation is not exceeded. |                 | N/A     |
| D.8.2.4     | Temperature measurements                                                                                                                                                                                                                                                              |                 | N/A     |
|             | Temperature measurements are made by means of thermocouples. Positioning of the thermocouples shall not damage the terminal or the reference conductor.                                                                                                                               |                 |         |
|             | For the measurement of the terminal temperature, the thermocouple shall be located on the conductor entry side of the terminal, close to the contact interface.                                                                                                                       |                 |         |
|             | For the measurement of the temperature of the reference conductor, the thermocouple shall be located midway between the ends of the conductor, and under its insulation.                                                                                                              |                 |         |
|             | The ambient air temperature shall be measured with two thermocouples in such a manner as to achieve an average and stable reading in the vicinity of the test loop without undue external influence.                                                                                  |                 |         |
|             | The thermocouples shall be located in a horizontal plane intersecting the specimens, at a minimum distance of 600 mm from them.                                                                                                                                                       |                 | N/A     |
| D.8.2.5     | Test method                                                                                                                                                                                                                                                                           |                 | N/A     |
|             | The test loop shall be subjected to 500 cycles; each cycle consists of an on-period and an off period as specified,                                                                                                                                                                   |                 | N/A     |
|             | Starting at the test current value given in Table D.4.                                                                                                                                                                                                                                |                 | N/A     |
|             | on-time:                                                                                                                                                                                                                                                                              |                 | N/A     |
|             | off-time:                                                                                                                                                                                                                                                                             |                 | N/A     |
|             | Near the end of each on-period of the first 24 cycles, the temperature of each terminal shall have attained a minimum of 105 °C. When necessary, the current shall be adjusted to achieve this condition.                                                                             |                 | N/A     |
|             | If the manufacturer demonstrates that the maximum temperature-rise of the terminals is less than 70 K, the 105 °C temperature may be reduced to this temperature-rise plus 35 °C.                                                                                                     |                 | N/A     |

| IEC 60947-2 |                                                                                                                                                                                                                                                                                                      |                 |         |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| Clause      | Requirement + Test                                                                                                                                                                                                                                                                                   | Result - Remark | Verdict |
|             | At the 25 <sup>th</sup> cycle, the test current shall be adjusted for the last time and the corresponding temperature, when stabilized at the final load current, shall be recorded as the first measurement. There shall be no further adjustment of the test current for the remainder of the test |                 |         |

|             | Alternatively, the test can be carried out by inserting the largest conductor of type and rated cross-section among those recommended by the manufacturer, the diameter of which corresponds to the theoretical diameter according to Table 7a, after the insulation has been removed and the end has been reshaped. The stripped end of the conductor shall be able to enter completely within the clamping unit aperture, without use of undue force. |                 | N/A     |

|             | Tests shall be made according to sequences II and III of this standard without the verification of overload releases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                 | N/A     |
| O.6.1.3     | Verification of short-circuit releases                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                 |         |
|             | Following the test of O.6.1.2, a tripping test is made in accordance with 8.3.3.1.2 on each phase pole in turn, at the maximum setting of the rated instantaneous short-circuit current. The test is made at the value of the tripping current declared by the manufacturer for individual poles . The ICB shall trip.                                                                                                                                                                                                                                                                                                                        |                 | N/A     |
| O.6.2       | ICB associated with a specified protected device (i.e. motor starter or overload relay)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                 |         |
|             | The applicable test requirements for these associations are covered in the relevant sections of IEC 60947-4-1, specifically the following clauses: <ul style="list-style-type: none"> <li>- co-ordination with short-circuit protective devices;</li> <li>- additional requirements for combination starters and protected starters suitable for isolation;</li> <li>- performance under short-circuit conditions;</li> <li>- co-ordination at the crossover current between the starter and associated SCPD.</li> </ul> <p>NOTE The symbol SCPD in IEC 60947-4-1 applies to various short-circuit protective devices, including the ICB.</p> |                 | N/A     |
